

Fix “Windows was unable to find a certificate to log you on to the network”

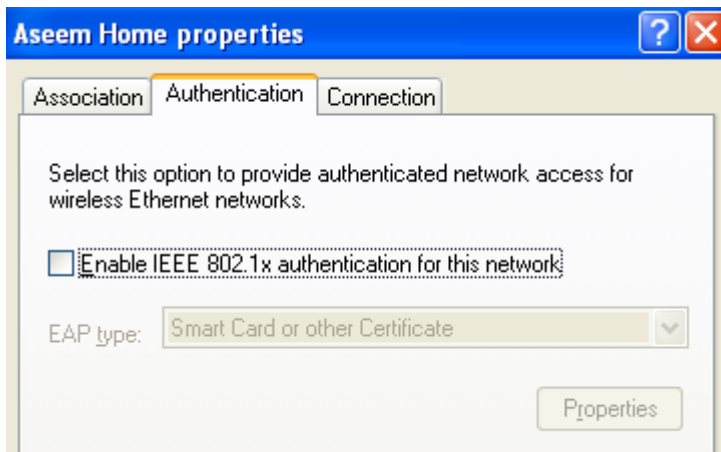

First, click on the wireless icon in your taskbar and under **Related Tasks**, choose **Change advanced settings**.

Now click on the **Wireless Networks** tab and select the network in the list at the bottom. Click on **Properties** once you select the [wireless network](#) that is having problems.

Click on the **Authentication** tab and now uncheck the **Enable IEEE 802.1x authentication for this network** box. If the box was checked, then that was why you were getting the “unable to find a certificate to log you on to the network” message because Windows is looking for one, but your wireless router is not setup for certificate security.

And that's it! Once you unchecked that box and tried to reconnect to the wireless network, everything will work fine! Enjoy!
